Oscillation – Set 3

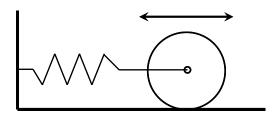

An oscillating block-spring system has a mechanical energy of  $1.00~\rm J$ , an amplitude of of  $10.0~\rm cm$ , and a maximum speed of  $1.20~\rm m/s$ .

- a) What is the spring constant?
- b) What is the mass of the block?
- c) What is the frequency of oscillation?

Use **ENERGY** techniques to answer the following question.

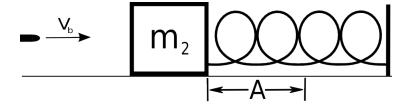

A solid cylinder of mass M=2 kg and radius R=1.0 m is attached to a horizontal spring with spring constant k=100 N/m. The cylinder can roll without slipping along the horizontal plane. When the system is displaced from the equilibrium position, it executes simple harmonic motion.

- a) Derive an expression for the period of the oscillations in terms of *M* and *k*.
- b) If the cylinder has a translational velocity of  $v_0$ =5.0 m/s as it passes through equilibrium, find the phase constant, the amplitude, and the maximum acceleration of the system.

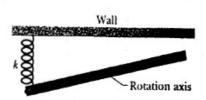

A block of mass  $m_2 = 10$  kg attached to a spring with spring constant k = 5 N/m is oscillating with an amplitude of A = 1.5 m horizontally on a frictionless surface. When the spring has reached its maximum extension to the left, it collides with a bullet with a mass  $m_1 = 5$  g moving  $V_b = 200$  m/s towards the right.

- a) What is the period of the oscillator after the collision?
- b) What is the amplitude of the oscillator after the collision?

A long uniform rod of length L and mass m is free to rotate in a *horizontal* plane about a vertical axis through its center (the picture shows a *top* view). A spring with force constant k is connected horizontally between one end of the rod and a fixed wall. When the rod is in equilibrium, it is parallel to the wall.

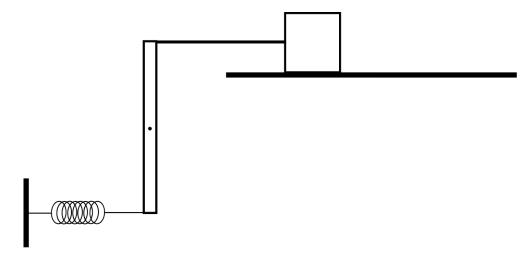

What is the period of the *small* oscillations that result when the rod is rotated slightly and then released?  $I_{cm} = \frac{1}{12}ML^2$  for the rod.

- a) Use **Newton's Second Law** to find the oscillator frequency.
- b) Use **Energy Techniques** to find the oscillator frequency.

Use **ENERGY** techniques to answer the following question.

A block of mass *M* resting on a frictionless surface is attached to a stiff rod of negligible mass. The other end of the rod is attached to the top of a thin bar of length *l* mass *M* that is allowed to rotate about its center. The bottom of a bar is attached to a light spring of spring constant k. The spring is relaxed when the bar is vertical. Find the frequency of small oscillations.

Oscillation – Set 3

Two particles are in simple harmonic motion in a straight line. They have the same amplitude and a period of 1.5 s but differ in phase by  $\pi/6$  radians.

- a) How far apart are they from one another (in terms of A) when the lagging particle is at its maximum position?
- b) Are they moving in the same direction or opposite directions?
- c) How far apart are they 0.5 seconds later?
- d) Are they moving in the same or opposite directions then?
